MATCHING A POWER SUPPLY – LENDING A HELPING HAND

When choosing a power supply, pay attention to power, voltage, current, and connectors

You can minimize downtime by following a few simple rules outlined in this paragraph.

Remember!

You can read the basic parameters from the **label** on the bottom of the laptop marked as **INPUT** or from the nameplate of the original power supply described as **OUTPUT**. These will be: **POWER (W)**, **VOLTAGE (V)**, **CURRENT (A)**.

The following points will clear up any doubts that may arise when choosing equipment:

1. **POWER (W)** – this number indicates the **minimum value** that the new power supply should have. There is nothing wrong with using a product with **higher power**. This will make it less stressed and therefore less hot.
2. **CURRENT (A)** – as with POWER, the value on the new power supply can be **equal to or higher** than that given on the laptop's nameplate.
3. **VOLTAGE (V)** – the number for this parameter is more strictly required. Only a **fluctuation of +/- 0.5V** is allowed.

The last and equally important issue is the **PLUG**. Without it, you're going nowhere! There are no deviations here, it is **necessary that it is identical to the original**. The given size indicates the outer diameter and the inner diameter of the pin. If comparing based on the provided photo is not enough, an accurate **measurement** will be necessary to finally **confirm your choice**.
