# embedded LCD-DISPLAY

## 240x128 WITH INTELLIGENCE

## **TECHNICAL DATA**

- \* LCD GRAPHICS DISPLAY WITH A RANGE OF GRAPHICS FUNCTIONS
- \* 8 BUILT-IN SOFT-FONTS
- \* FONT ZOOM FROM approx. 2mm TO approx. 50mm, also ROTATED BY 90°
- \* 3 DIFFERENT ONBOARD INTERFACES: RS-232, I<sup>2</sup>C BUS OR SPI BUS
- \* 240x128 PIXELS WITH LED BACKLIGHT, BLUE NEGATIVE OR
- \* BLACK&WHITE POSITIVE, FSTN TECHNOLOGY OR AMBER
- \* POWER SUPPLY +5V@ TYPICAL 75mA / 210mA (WITHOUT / WITH LED BACKLIGHT)
- \* POSITIONING ACCURATE TO THE PIXEL WITH ALL FUNCTIONS
- \* STRAIGHT LINE, POINT, AREA, AND/OR/EXOR, BAR GRAPH...
- \* CLIPBOARD FUNCTIONS, PULL-DOWN MENUS
- \* UP TO 256 IMAGES STORABLE INTERNALLY
- \* UP TO 256 MACROS PROGRAMMABLE (32 kB EEPROM ONBOARD)
- \* COMBINATIONS OF TEXT AND GRAPHICS, FLASHING ATTRIBUTES: ON/OFF/INVERTED
- \* BACKLIGHT CAN BE SWITCHED BY SOFTWARE
- \* ANALOG TOUCH PANEL: VARIABLE GRID
- \* FREELY DEFINABLE KEYS AND SWITCHES

## ORDER DESIGNATION

240x128 DOTS, WHITE LED BACKLIGHT, BLUE NEGATIVE AS ABOVE, BUT WITH TOUCH PANEL

240x128 DOTS, WHITE LED BACKLIGHT, POSITIVE MODE, FSTN AS ABOVE, BUT WITH TOUCH PANEL

240x128 DOTS, AMBER LED BACKLIGHT, FSTN AS ABOVE, BUT WITH TOUCH PANEL

## **GENERAL**

EA eDIP240-7 is the world's first display with integrated intelligence! As well as a number of built-in fonts which can be used with pixel accuracy it also features a whole range of sophisticated graphics functions.

Supplied with 5V, the display is ready for operation immediately. It is controlled via one of the 3 integrated RS-232, SPI or I<sup>2</sup>C interfaces.

Graphics commands similar to high-level languages are used for programming. There is no longer any need for the time-consuming programming of character sets and graphics routines. The ease of use of this display with its touch panel reduces development time dramatically.

## **HARDWARE**

The display is designed to work with an operating voltage of +5V. Data transfer is either serial and asynchronous using the RS-232 format or synchronous using the SPI or I<sup>2</sup>C specification. A simple protocol is used for all data transfer variants to improve data reliability.

## **ANALOGTOUCH PANEL**

The EA eDIP240B-7LWTP and EA eDIP240J-7LWTP versions are equipped with an integrated touch panel. You can make entries and menu or bar graph settings by touching the display. The labeling of the "keys" is flexible and can also be changed during runtime (different languages, icons). The drawing of the individual "keys" and the labeling is handled by the integrated software.

## LED BACKLIGHT, TYPES B AND J

All displays in blue-and-white (B) and black-and-white (J) are equipped with a modern, low power consumption LED backlight. Whereas the black&white and the amber-colored display can still be read even when the backlight is switched off completely, the blue-white display requires a minimum level of illumination to be legible. The backlight can be switched off with a software command and the brightness can be adjusted.

We recommend the black&white version for use in direct sunlight. For all other applications, we recommend the high-contrast, blue-white version.

Note that the white LED backlight is subject to aging. That means switching off or dimming backlight is a must for 24-hour-applications. Not so for the amber backlight.

## **SOFTWARE**

The display is programmed by means of commands, such as *Draw a rectangle from (0,0) to (64,15)*. No additional software or drivers are required. Strings can be placed with **pixel accuracy**. Flashing attributes can be assigned as often as you like – for graphics as well. Text and graphics can be combined at any time. Up to 16 different character sets can be used. Each one can be zoomed from 2 to 4 times. With the largest character set, the words and numbers displayed will fill the screen.

#### **ACCESSORIES**

Programmer for internal EEPROM

The display is supplied fully programmed with a complete set of fonts. The additional programmer is thus generally not required.

If, however, the internal character sets are to be modified or extended, or if images or macros are to be stored internally, the additional EA 9777-1USB-programmer, available as an accessory) will permanently write the data you create to the onboard EEPROM (32 kB).

The Programmer runs under Windows and is connected to the PC's USB interface. A power supply is not required, and an interface cable are supplied together with the programmer.

## **SPEZIFICATION AND CHARACTERISTICS**

	Charac	teristics			
Value	Condition	min.	typ.	max.	Unit
Operating Temperature		-20		+70	°C
Storage Temperature		-30		+80	ů
Storage Humidity	< 40°C			90	%RH
Operating Voltage		4.5	5.0	5.5	V
Input Low Voltage		-0.5		0.2*VDD	V
Input High Voltage	Pin Reset only	0.9*VDD		VDD+0.5	V
Input High Voltage	except Reset	0.6*VDD		VDD+0.5	V
Input Leakage Current	Pin MOSI only			1	uA
Input Pull-up Resistor		20		50	kOhms
Output Low Voltage				0.7	V
Output High Voltage		4.0			V
Output Current				20	mA
Current	Backlight off		75		mA
Current	Backlight on		210		mA

## RS-232/RS-422 INTERFACE

Wiring the display as shown below selects the RS-232/RS-422 interface. The pin assignment is shown in the table on the right.

The RxD and TxD lines have a 5V CMOS line level. If "genuine" RS-232 levels are required (e.g. for direct connection to a PC), an external level converter such as the ICL232 is necessary.

	Pinout eDIP240-7							
L.	RS-232 / RS-422 mode							
Pin		In/Out	Function		Pin	•	Function	
1	GND	-	Ground Potential for logic (0V)		21	N.C.	not connected	
2	VDD	-	Power supply for logic (+5V)		22	N.C.	not connected	
3	VADJ	In	Operating voltage for LC driving (input)		23	N.C.	not connected	
4	VOUT	Out	Output voltage for LC driving		24	N.C.	not connected	
5	RESET	-	L: Reset		25	N.C.	not connected	
6	BAUD0	In	Baud Rate 0		26	N.C.	not connected	
7	BAUD1	In	Baud Rate 1		27	N.C.	not connected	
8	BAUD2	In	Baud Rate 2		28	N.C.	not connected	
9	ADR0	In	Address 0 for RS-485 (V1.3 or later)		29	N.C.	not connected	
10	RxD	In	Receive Data		30	N.C.	not connected	
11	TxD	Out	Transmit Data		31	N.C.	not connected	
12	EN485	Out	Transmit Enable for RS-485 driver		32	N.C.	not connected	
13	DPOM	In	L: disable Power-On-Macro do not connect for normal operation		33	N.C.	not connected	
14	ADR1	In	Address 1 for RS-485 (V1.3 or later)		34	N.C.	not connected	
15	ADR2	In	Address 2 for RS-485 (V1.3 or later)		35	N.C.	not connected	
16	BUZZ	Out	Buzzer output		36	N.C.	not connected	
17	EEP_SDA	Bidir.	Serial Data Line for int. EEPROM		37	N.C.	not connected	
18	EEP_SCL	Out	Serial Clock Line for int. EEPROM		38	N.C.	not connected	
19	EEP_WP	In	H: Write Protect for int. EEPROM		39	N.C.	not connected	
20	TEST SBUF	IN Out	open-drain with internal pullup 2050k IN (Power-On) L: Testmode OUT L: data in sendbuffer		40	N.C.	not connected	

#### Note:

At pin 20 (SBUF), the display sets a low level to indicate that data is available to be fetched from the internal send buffer. This line can, for instance, be connected to an interrupt input of the host system.

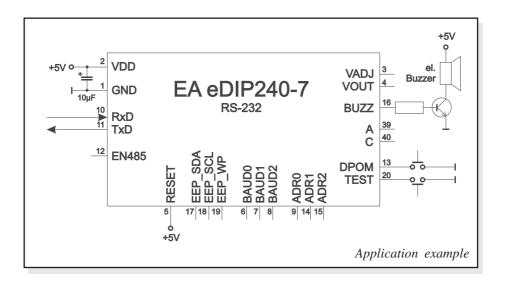

## **BAUDRATES**

The baud rate is set with pins 6, 7 and 8 (Baud0 through 2). The data format is set permanently to 8 data bits, 1 stop bit, no parity.

RTS/CTS handshaking lines are not required. The integrated software protocol takes on the necessary control functions (see pages 8 and 9).

	Baud rates										
Raud0	Baud1	Rauda	Data format								
Daudo	Daudi	Dauuz	8,N,1								
0	0	0	1200								
1	0	0	2400								
0	1	0	4800								
1	1	0	9600								
0	0	1	19200								
1	0	1	38400								
0	1	1	57600								
1	1	1	115200								

## **SPIINTERFACE**

Wiring the display as shown below activates SPI mode. Data is then transferred over the serial, synchronous SPI interface. The DORD, CPOL and CPHA inputs are used to match the hardware

conditions to the master. For example (see diagram below).

A reasonable communication is possible up to 100 kHz.

Clock frequency may be rised up to 3 MHz, but in this case make shure, that there is a pause between 2 bytes of min. 100  $\mu$ s.

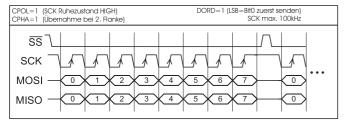

Λ	V	n	1	0	
1	٧	v	ı	·	٠

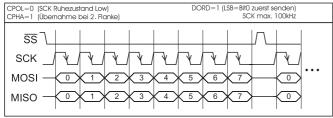

At pin 20 (SBUF), the display sets a low level to indicate that data is available to be fetched from the internal send buffer. This line can, for instance, be connected to an interrupt input of the host system.

	Pinout eDIP240-7								
			SPI mode						
Pin	Symbol	In/Out	Function		Pin	Symbol	Function		
1	GND	-	Ground Potential for logic (0V)		21	N.C.	not connected		
2	VDD	-	Power supply for logic (+5V)		22	N.C.	not connected		
3	VADJ	In	Operating voltage for LC driving (input)		23	N.C.	not connected		
4	VOUT	Out	Output voltage for LC driving		24	N.C.	not connected		
5	RESET	-	L: Reset		25	N.C.	not connected		
6	SS	In	Slave Select		26	N.C.	not connected		
7	MOSI	In	Serial In		27	N.C.	not connected

9	CLK	In	Shift Clock		29	N.C.	not connected		
10	DORD	In	Data Order (0=MSB first; 1=LSB first)		30	N.C.	not connected		
11	SPIMODE	In	connect to GND for SPI interface		31	N.C.	not connected		
12	OUT2	Out	open-drain with internal pullup 2050k (V1.6 or later)		32	N.C.	not connected		
13	DPOM	ln	L: disable Power-On-Macro do not connect for normal operation		33	N.C.	not connected		
14	CPOL	In	Clock Polarity (0=LO 1=HI when idle)		34	N.C.	not connected		
15	СРНА	ln	Clock Phase (sampled on 0=1st 1=2nd edge)		35	N.C.	not connected		
16	BUZZ	Out	Buzzer output		36	N.C.	not connected		
17	EEP_SDA	Bidir.	Serial Data Line for int. EEPROM		37	N.C.	not connected		
18	EEP_SCL	Out	Serial Clock Line for int. EEPROM		38	N.C.	not connected		
19	EEP_WP	In	H: Write Protect for int. EEPROM		39	N.C.	not connected		
20	TEST SBUF	IN Out	open-drain with internal pullup 2050k IN (Power-On) L: Testmode OUT L: data in sendbuffer		40	N.C.	not connected		

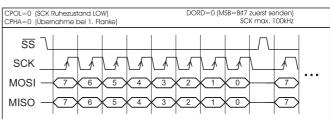

## **DATATRANSFERSPI**

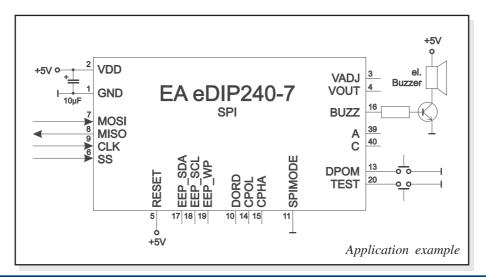

Via pins DORD, CPOL and CPHA transfer parameter will be set.

## **I<sup>2</sup>C BUS INTERFACE**

Wiring the display as shown below allows the display to be operated directly on an I<sup>2</sup>C bus.

4 different base addresses and 8 different slave addresses can be selected at the display.

A data transmission rate of up to 100kHz is possible.

If transmitter will pause for min.  $100~\mu s$  between each byte, SCL may rise u to max. 400~kHz.

	Pinout eDIP240-7									
	I <sup>2</sup> C-Bus mode									
Pin	Symbol	In/Out	Function		Pin	,	Function			
1	GND	-	Ground Potential for logic (0V)		21	N.C.	not connected			
2	VDD	-	Power supply for logic (+5V)		22	N.C.	not connected			
3	VADJ	ln	Operating voltage for LC driving (input)		23	N.C.	not connected			
4	VOUT	Out	Output voltage for LC driving		24	N.C.	not connected			
5	RESET	-	L: Reset		25	N.C.	not connected			
6	BA0	In	Basic Address 0		26	N.C.	not connected			
7	BA1	In	Basic Address 1		27	N.C.	not connected			
8	SA0	In	Slave Address 0		28	N.C.	not connected			
9	SA1	In	Slave Address 1		29	N.C.	not connected			
10	SA2	In	Slave Address 2		30	N.C.	not connected

## **DATATRANSFERI2C-BUS**

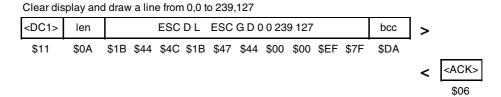

## DATATRANSFER PROTOCOL (SMALL PROTOCOL)

The actual data transfer is embedded in a fixed frame with a checksum (protocol packet). The EA eDIP240-7 acknowledges this packet with <ACK> (=\$06) if it is received correctly or <NAK> (=\$15) if the checksum is incorrect or buffer is full (packet is rejected and must be re-sent).

If no acknowledgement is sent, at least one byte has been lost. If the missing bytes are not received within the preset timeout of 2 seconds, the entire packet is rejected and must be re-sent. The data length (len) of a packet is restricted to a maximum of 64 bytes.

## **EXAMPLE**

The following example shows a complete protocol packet for sending commands:

## **SWITCHOFF SMALL PROTOCOL**

The protocol is identical for all three interfaces (RS-232, I<sup>2</sup>C and SPI). For testing purposes, the protocol can be deactivated by closing the solder strap J2 (see page 20). We urgently recommend, however, that the protocol is activated for normal operation. If this is not done, it would not be possible to detect a receive buffer overflow.

## THE 5 PACKETVARIANTS IN DETAIL

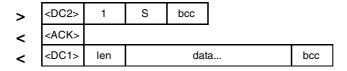

Send commands/data to the display

The user data is sent enclosed in <DC1>, the data length "len" and the checksum "bcc". The display responds with <ACK>.

```
<DC1> = 17(dec.) = $11
len = size of user data in bytes (without checksum, without <DC1>, max. 64)
bcc = 1 byte = sum of all bytes including <DC1> and len, modulo 256
<ACK> = 6(dec.) = $06
```

## Request content of the send buffer

The command sequence <DC2>, 1, S, bcc flushes the display's send buffer. The display first responds with <ACK> and then starts sending all the collected data such as the pressed touchkeys. Note: "S" has to be a capital letter.

<DC2> = 18(dec.) = \$12 <ACK> = 6(dec.) = \$06 len = size of user data in bytes (without checksum, without <DC1>)bcc = 1 byte = sum of all bytes including <DC1> and len, modulo 256

## Repeat last data packet

>	<dc2></dc2>	1	R	bcc		
<	<ack></ack>				l	
<	<dc1> <dc2></dc2></dc1>	len		dat	a	bcc

If the packet most recently requested contains an incorrect checksum, the complete packet can be requested again. The response can then be the content of the send buffer (<DC1>) or the buffer information (<DC2>). Note: "R" has to be a capital letter.

```
<DC2> = 18(dec.) = $12

bcc = 1 byte = sum of all bytes including <DC1> or <DC2> and len, modulo 256

<ACK> = 6(dec.) = $06

<DC1> = 17(dec.) = $11

len = size of user data in bytes (without checksum, without <DC1> or <DC2>)
```

## Request buffer information

>	<dc2></dc2>	1	I	bcc		
<	<ack></ack>				•	
<	<dc2></dc2>	2	send l bytes		receive buffer bytes free	bcc

This command queries whether user data is available to be fetched and how full the receive buffer of the display is. The data itself is only transferred with the command "Request content of the send buffer" (see above). Note: "I" has to be a capital letter.

## Protocol settings

This allows the maximum packet size the display is permitted to send to be restricted. The default setting is a packet size with up to 64 bytes of user data. In addition, the timeout (default = 2 seconds) can be set in 1/100s increments.

```
<DC2> = 18(dec.) = \$12
packet size = 1 through 64 (default: 64)
timeout = 0 through 255 in 1/100 second increments (default: 200 = 2 seconds)
bcc = 1 byte = sum of all bytes including <DC2> and len, modulo 256
<ACK> = 6(dec.) = \$06
```

## **TOUCH PANEL**(EAeDIP240x-7LWTP only)

The versions -7xxTP are supplied with an analog resistive touch panel. Up to 60 touch regions (buttons, switches, menus, bar graph entries), can be defined simultaneously. The fields can be defined to single-pixel accuracy. The display supports representation using easy-to-use commands (see page 15). When the touch "keys" are touched, they can be automatically inverted and an external buzzer (pin 16) can sound, indicating they have been touched. The defined return code of the "key" is transmitted via the serial interface, or an internal touch macro with the number of the return code is started (see page 18, *Macro programming*).

#### **TOUCH PANEL ADJUSTMENT**

The touch panel is perfectly adjusted and immediately ready for operation on delivery. As a result of aging and wear, it may become necessary to readjust the touch panel.

Adjustment procedure:

- 1. Touch the touch panel at power-on and keep touching it. After the message "touch adjustment?" appears, release the touch panel again (or issue the 'ESC @' command).
- 2. Touch the touch panel again within a second for at least a second.
- 3. Follow the instructions for adjustment (press the 2 points upper left and lower right).

## FRAMES AND KEY FORMS

A frame type can be set by using the *Draw frame* or *Draw frame box* command or by drawing touch keys. 18 frame types are available (0= do not draw a frame).

## BITMAPS AS KEYS

In addition to the frame types, which can be scaled to any size, you also have the option of using any bitmap images (in each case, a pair showing the *not pressed* and *pressed* statuses) as touch keys or switches.

The LCD-Tools\*) allows you to incorporate your own buttons in the form of images (compiler statement "PICTURE"). A button always comprises two monochrome

Windows BMPs of the same size (one bitmap showing the normal representation of the touch key and one showing the pressed touch key). The active area of the touch key is derived automatically from the size of the button bitmaps.

9	10
---	----

## SWITCHES IN GROUPS (RADIO GROUP)

Touch switches change their status from *ON* to *OFF* and vice versa each time they are touched. A number of touch switches can be grouped together (command: 'ESC A R nr'). If a touch switch in an 'nr' group is now switched on, all other buttons in this group are automatically switched off. This means that one button is only ever on at a time.

<sup>\*)</sup> see our web site at <a href="http://www.lcd-module.de/deu/touch/touch.htm">http://www.lcd-module.de/deu/touch/touch.htm</a>

## INTEGRATED AND EXTERNAL FONTS

Apart from the 8x8 terminal font (font no. 8), 3 additional monospaced fonts, 3 proportional fonts and 1 large numeric font are integrated as standard. The proportional fonts result in a more attractive appearance, and at the same time require less space on screen (e.g. the "i" is narrow and the "W" is

wide). Each character can be positioned with pixel accuracy and the width and height can be scaled by a factor of 1 - 4.

Each text can be output left justified, right justified or centered. 90° rotation e.g. for vertical installation of the display is also possible. Macro programming permits additional fonts to be integrated (up to 15). This is be done with a text editor and programmed using the LCD-Tools\*) (EA 9777-1USB).

## **TYPEFACE**

This picture of a screen image shows all the integrated standard fonts.

Macro programming permits some additional fonts to be integrated. Any conceivable font (including Chinese or Cyrillic) can be created with a text editor and programmed using the LCD-Toolkit\*) and programmer EA 9777-1USB.

<sup>\*)</sup> see our web site at http://www.lcd-module.de/deu/touch/touch.htm

## **DEFAULT SETTINGS**

After power on or a reset, some functions are set to a particular value (see last column entitled 'After reset' in the table). Please note that all the settings can be overwritten by creating a power-on macro.

				Respor	nse of E	A eDIP240-7 via serial interface
le	d	num		data		Remark
					ı	Automatic response
ESC	A	1	code			Response from the analog touch panel when a key/switch is pressed. code = down code of the key/switch.  Only transmitted if no corresponding touch macro is defined!
ESC	N	1	code			After a menu item is selected by touch, the selected menu item code is transmitted. transmitted if no corresponding touch macro is defined!
ESC	В	2	no	value		When a bar graph is set by touch, the current value of the bar is transmitted with no Transmission of the bar value must be activated (see the 'ESC A Q n1' command).
ESC	T	0				When automatic-open-mode for menu function is disabled (via command 'ESC N T this request will be sent to host. Then it is necessary that host will open menu with command 'ESC N T 2'.
ESC	Н	3	type	x1 y1		The following is transmitted in the case of a free touch area event: type=0 release; t is touch; type=2 is drag within the free touch area at the x,y coordinates (16-bit values)
		_			Respo	nse only when requested
ESC	N	1	no			After the 'ESC N S' command, the currently selected menu item is transmitted. no=0: no menu item is selected.
ESC	В	2	no	value		After the 'ESC B S n1' command, the current value of the bar is transmitted with no.
ESC	х	2	code	value		After the 'ESC A X' command, the current status of the touch switch is transmitted w code (the return code). value = 0 or 1
ESC	٧	count		char. string		After the 'ESC S V' command, the version of the KIT firmware is transmitted as a str (end code is the character NUL = \$00). The first two bytes of the string always start 'EA'
				Res	ponse wi	thout length specification (num)
ESC	U	٦	x1	y1 *.blh ima	age data	After command 'ESC UH' is received a screen copy will be sent x1,y1 = coordinates of the top left corner *.blh image data: 2 bytes (width, height) + count of image data ((width+7)/8*height)

#### *Note:*

At pin 20 (SBUF), the display sets a low level to indicate that data is available to be fetched from the internal send buffer. This line can, for instance, be connected to an interrupt input of the host system.

## **TERMINAL MODE**

When you switch the unit on, the cursor flashes in the first line, indicating that the display is ready for operation. All the incoming characters are displayed in ASCII format on the terminal (exception: CR,LF,FF,ESC,'#'). To achieve this, a correctly functioning protocol frame is required (pages 8 and 9) or the protocol must be deactivated (close solder strap J2, page 8 and 20). Line breaks are automatic or can be executed by means of the 'LF' character. If the last line is full, the contents of the terminal scroll upward. The 'FF' character (page feed) clears the terminal. The character '#' is used as an escape character

The character '#' is used as an escape character and thus cannot be displayed directly on the terminal. If the character '#' is to be output on the terminal, it must be transmitted twice: '##'.

The terminal has a separate output layer and is thus completely independent of the graphic outputs. If the graphics screen is cleared with 'ESC DL', for example, that does not affect the contents of the terminal window.

Terminal-Font (Font 0): 8x8 monospaced

The terminal font is permanently in ROM and can also be used for graphics output 'ESC Z...' (set FONT no.=0).

## PASSING COMMANDS/PARAMETERS

The eDIP240-7 can be programmed by means of various integrated commands. Each command begins with ESCAPE or HASH followed by one or two command letters and some parameters. There thus are two ways to send commands:

#### 1. ASCII mode

- The ESC character corresponds to the character '#' (hex: \$23, dec: 35).
- The command letters come directly after the '#' character.
- The parameters are transmitted as plain text (several ASCII characters) followed by a separating character (such as a comma ',').
- Strings (text) are written directly without quotation marks and terminated with CR (hex: \$0D) or LF (hex: \$0A).

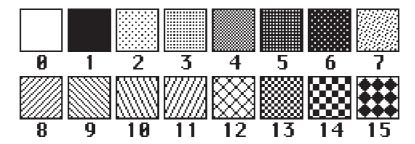

## 2. Binary mode

- The escape character corresponds to the character ESC (hex: \$1B, dec: 27).
- The command letters are sent directly.
- The x, y coordinates and all the other parameters are transmitted as 8-bit binary values (1 byte).
- Strings (text) are terminated with CR (hex: \$0D) or LF (hex: \$0A) or NUL (hex: \$00).

No separating characters, such as spaces or commas, may be used in binary mode. The commands require **no final byte**, such as a carriage return (apart from the string: \$00).

#### **FILL PATTERNS**

A pattern type can be set as a parameter with some commands. In this way, rectangular areas and bar graphs for instance can be filled with different patterns. There are 16 internal fill patterns available.

## **MACRO PROGRAMMING**

Single or multiple command sequences can be grouped together in macros and stored in the EEPROM. You can then start them by using the *Run macro* commands. There are different types of macro:

Normal macros (0 through 255)

These are started by means of an 'ESC MN xx' command via the serial interface or from another macro. A series of macros occurring one after the other can be called cyclically (movie, hourglass, multi-page help text). These automatic macros continue to be processed until a command is received via RS-232 or another macro is activated.

Furthermore these macros may be started by "macro processes" as an individual task (from V1.1). Process macros will not be interupted by any other commands or touch panel use.

Touch macro (1 through 255)

Started when you touch/release a touch field (only in versions with a touch panel - TP) or issue an 'ESC MT xx' command.

Menu macro (1 through 255)

Started when you choose a menu item or issue an 'ESC MM xx' command.

Power-on macro

Started after power-on. You can switch off the cursor and define an opening screen, for example.

Reset macro

Started after an external reset or after a voltage dip under 4.7V (VDD-VSS).

Watchdog macro

Started after a fault/error (e.g. crash).

Brown-out macro

Started after a voltage dip <4V.

**Important:** If a continuous loop is programmed in the power-on, reset or watchdog macro, the display can no longer be addressed. In this event, execution of the power-on macro must be suppressed. This is achieved by wiring DPOM appropriately.

PowerOff - connect pin 13 (DPOM) to GND - PowerOn - disconnect pin 13 again.

## WRITE PROTECTION FOR MACRO PROGRAMMING AND FONTS

A VDD line level at pin 19 (EEP\_WP) prevents inadvertent overwriting of the macros, images and fonts in the EEPROM (recommanded in any case!).

## **MEMORY EXPANSION**

The size of the internal EEPROM memory is 32 kB. Generally, this allows sufficient space for a large number of images and macros. If, however, a very large number of images (in particular full-size images) are to be stored, it can be necessary to expand the memory. The memory capacity can be doubled by directly connecting a standard EEPROM of the 24C256 series. It is connected over pins 17, 18 and 19 (I2C adress \$A6) or can be placed direct as U12 (see drawing on page 20).

## **IMAGES STORED IN EEPROM**

To reduce the transmission times at the interface or to save storage space in the processor system, up to 256 images can be stored in the internal EEPROM. They can be called using the "ESC U I" command or from within a macro. Any images in Windows BMP format (monochrome images only) can be used. They can be created and edited using commercial software such as Windows Paint or Photoshop (only black and white = 1 bit).

## CREATINGYOUR OWN MACROS AND IMAGES

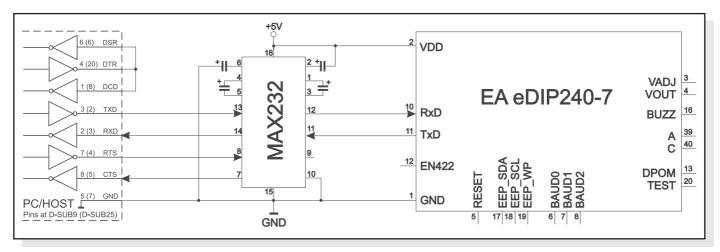

To create your own macros, you need the following:

- the additional EA 9777-1USB programmer (available as an accessory) or self-created adaptor like application example below,
- the ELECTRONIC ASSMBLY LCD-Tools\*) software; this contains a KIT-Editor, KIT-Compiler, Simulator, and examples and fonts (for Windows PCs)
- a PC with a serial port USB or COM

To define a sequence of commands as a macro, all the commands are written to a file on the PC (e.g. DEMO.KMC). You specify which character sets are to be integrated and which command sequences are to be in which macros.

If the macros are defined using the KIT Editor, the KIT Compiler is started by pressing F5. This creates a file with the name DEMO.EEP which immediately shows the results in a simulator window (virtual display). If display is connected via USB programmer EA 9777-1USB or application below, this file is then automatically burned into the display's EEPROM. The KIT Compiler recognizes the display with or without the small protocol being activated.

The actual programming operation only takes a few seconds, and you can then use your user-defined macros and images on the display immediately. You will find a detailed description of how to program macros along with examples in the online Help for the ELECTRONIC ASSEMBLY LCD-Tools\*) software.

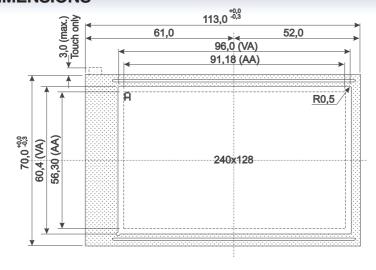

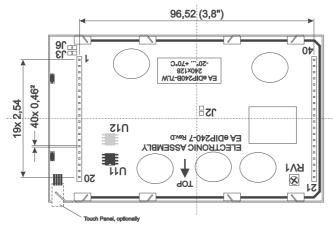

Application example to direct pc interfacing

## EAeDIP240-7

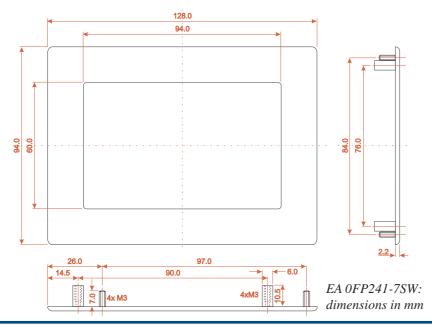

Page 20

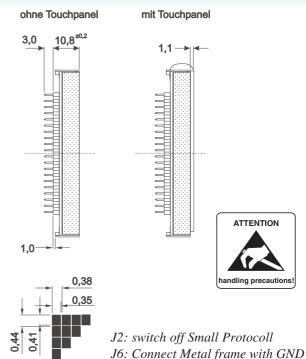

## **DIMENSIONS**

## **ALUMINIUM BEZEL**

(ESD / EMV)

Notes on handling and operation
- LC dispalys are designed for hand soldering only.
Reflow and wave soldering may destroy lcd
immediately

all dimensions are in mm

- The following can lead to the electronic destruction of the module: cross-polarity or overvoltage of the power supply, overvoltage or cross-polarity or static discharge at the inputs, short-circuits at the outputs.
- The power supply must be disconnected before the module is removed. All inputs must also be free of voltage.
- The display and the touch screen are made of plastic and must not come into contact with hard objects. The surfaces can be cleaned with a soft cloth. No solvents may be used.
- The module is designed only for operation within buildings. Additional measures must be taken to allow operation in the open air. The maximum temperature range of -20 through +70°C must not be exceeded. The module may not operate correctly and may fail if used in a humid environment. The display must be shielded from direct sunlight.
